Cumulative Results

This page contains the latest cumulative results of the current contest. All scores are updated hourly as the current city is updated. The highest (worst) normalized score (indicated in red) for each forecaster is dropped and the remaining normalized scores are averaged together to determine the forecaster's cumulative score. The team scores are calculated using a weighted formula. The number of forecasters indicated in the Team Score section are the number of valid (normalized scores < 20, full year registration) forecasters for each team. For more information on how cumulative scores are calculated, please visit the [Rules](#) page. **These results do not include any non-human results (NWS, Models, etc.) in the rankings. As a result, your cumulative rank on this page may be slightly different than the one shown on the daily scores pages.**
